## Scope of Work

### Dashboard & analytics

- Visits chart for the last 30 days, a list of recent view sessions and the currently active share links.
- Per-document stats: number of visits and downloads, average viewing time and how much of the document each viewer read.
- Each view session shows who opened the file (email, where available), browser, approximate location, time spent and completion rate.
- **Page-level engagement:** which pages each viewer opened, how long they spent on each page, and how often they came back to the same document.
- **Video play metrics** for videos shared through a link or dataroom.
- **Link click tracking:** links inside a shared document stay clickable in the viewer, and each click is recorded so you can see what the viewer followed up on.
- **Dataroom analytics:** combined visit statistics for each dataroom link (unique visitors, average viewing time), and view counts shown next to each document in the file list.

### Document management

- Upload single files or whole folders. PDFs, images, presentations, videos and other common formats are supported.
- In-browser document preview, so viewers can read files without downloading them.
- Star important files, sort by name, owner, date or size, and restore deleted items from Trash.
- Drag-and-drop upload of files and folders, with duplicate names handled automatically.
- Rename, copy, move and download documents, and act on several items at once with bulk selection.
- **Version history:** every document keeps its earlier versions, and you can restore or promote any of them to be the current version.
- Documents imported from Google Drive, Dropbox or Nextcloud can be refreshed to the latest cloud version in one click, keeping the document history.
- Word, Excel and PowerPoint files are previewed in the browser as well as PDFs and images.

### Secure share links

Each shared link can be set up with any combination of the controls below:

- **Email required:** the viewer has to enter their email address before the document opens.
- **Email verification:** a one-time verification link is sent to the viewer, which confirms the email address is real.
- **Password protection** for sensitive files.
- **NDA acceptance:** your own NDA text, which the viewer must accept before viewing.
- **Download control:** allow or block downloads for each link.
- **Watermark:** custom text stamped across every page, with the option of adding the viewer's email and IP address.
- **Q&A:** viewers can ask questions against a document and your team replies from the admin side, keeping all communication in one thread. Q&A can be switched on or off for each link and each dataroom.
- **Link expiry:** set a date and time after which the link stops working.
- **Email alerts** when someone opens a shared document, plus the option to switch a link on or off at any time.

- **Reliable email verification:** verification links are not used up by company email scanners, so viewers are not locked out before they open the file.
- Access pages (password, email verification and NDA) show Allure Clinic branding and only a masked version of the sender's details.

### Datarooms

- Folder-style spaces for grouping related documents, for example by department, supplier or project.
- Add collaborators to a dataroom. They can see and upload only to the datarooms they are added to.
- Separate share links, Q&A and settings for each dataroom.
- Nested folders inside a dataroom. The same document can appear in more than one folder, and items can be renamed inside a dataroom without changing the original.
- Set the order of folders and documents, so reviewers see them in the sequence you choose.
- Drag-and-drop upload of files and folders straight into a dataroom.
- **Dataroom branding:** a banner image and theme colours for each dataroom.
- **Reviewer experience:** inline viewer with a folder tree, next and previous document navigation, keyboard shortcuts, links straight to a specific document, and a layout that works on mobile.
- Videos play inside the dataroom without being downloaded.
- **Storage and ownership:** each dataroom has its own storage quota, separate from any user's personal quota. Owners can add teammates and transfer the dataroom to another user, and admins can see and manage every dataroom in the organisation.

### File requests

- Create a public upload link to collect documents from patients, staff, job applicants or vendors, without giving them an account.
- For each request you can set the destination folder, expiry date, maximum file size and allowed file types.
- Custom intake fields (name, ID, reference number, and so on), each with a required or optional setting.
- All submissions are collected in one place, against the request they came from.
- **Virus scanning:** every file uploaded through a public link is scanned before it is stored. Infected files are blocked, and blocked or failed scans are recorded as security events for the admin team.
- Embed the upload form on the clinic's own website or intranet page.
- Export submitted files to a connected Google Drive, Dropbox or Nextcloud folder, manually or automatically.

### Workflow automation & notifications

- **Event rules:** send a notification when something happens, such as a document being opened or downloaded, activity in a dataroom, or a file request security event.
- **Destinations:** email, Slack and other chat tools, and webhooks for passing events to other systems. The same event can go to several destinations.
- **Email digests:** several views in one session are combined into a single summary email instead of one email per click.
- **Delivery log:** every notification is logged, with retry and replay if a destination was unavailable.
- Notification emails are sent in the language set by the account owner.

### AI assistant integration (optional)

The platform includes an official server that lets AI assistants supporting the Model Context Protocol (MCP), such as Claude Desktop, Claude Code, Codex, Cursor or VS Code, manage documents, datarooms and share links and read viewer analytics using plain-language instructions.

- **27 built-in actions:** upload documents, organise folders, create and update datarooms, search documents by title or description, create and edit share links (email verification, NDA, watermark, expiry), and read viewer analytics and view sessions. Administrators can also review users and login activity.
- The actions cover files, links and analytics. The assistant does not read or summarise the contents of documents.
- **Personal API keys** with three permission levels (read-only, read-write and full access), created by each user in Settings. Keys are stored as one-way hashes, and the API keys page shows setup instructions for common AI clients.
- Watermark, NDA and download settings are applied by the platform when documents are viewed. An assistant using a read-write or full-access key can also edit these settings on a link, so we recommend read-only keys for general use.
- A ready-made assistant skill is included, which gives assistants sensible defaults for uploading and sharing, offers to group several uploads into a dataroom, and limits batch uploads to 50 files.
- The connection is not reachable from outside the server unless we configure it. We will only set it up if Allure Clinic decides to use it.

### Admin panel & users

- Create as many users as you need, for example doctors, admin staff and management, each with their own login.
- Assign roles and set storage quotas for each user.
- No cap on the number of users or on storage. The only practical limit is the capacity of your server.
- Login activity log and security alerts.
- Branding settings for the platform name, logo and colours.
- Overview cards, search, filters and paging across users, datarooms and share links.
- A detail page for each user showing storage use, share links and datarooms. Storage quotas can be set per user, with a default for everyone else, and recalculated at any time.
- Reset a user's password from the admin panel, control who can register an account, and set password rules.
- Security events (blocked uploads and failed scans) are listed alongside login activity.
- The interface is in English. German, Simplified Chinese and Russian language packs are also built into the platform.

### Integrations

- Import documents directly from Google Drive, Dropbox and Nextcloud.
- REST API with Swagger documentation, for connecting other clinic systems later if needed.
- API keys with read-only, read-write or full-access permission, for connecting other systems.
- Optional error monitoring through Sentry, if your IT team uses it.

### Branding, deployment & handover

- **Allure Clinic logo and colours** applied to the login page, the viewer pages, datarooms, the verification and NDA pages, the upload forms and the notification emails. No StandardTouch or third-party branding will be visible to your users.
- Installation on your server, set up on a subdomain of your choice (for example docs.allureclinic.com) with an SSL certificate.
- Email notifications configured using your SMTP or Google Workspace account.
- Web server set up with SSL and protection against bots and scanners (Fail2ban).
- Virus scanning service installed and tested with your file request links.

- **One live online training session** for your admin team, plus a short written user guide. Both cover the additional features listed above.

## 2. Hosting

The platform will be installed on a server owned and controlled by Allure Clinic. Documents are stored on that server. Google Drive can also be connected as a source for importing files. We will share the exact server specification before we start. As a rough guide, a Linux server (Ubuntu 22.04 or later) with 4 vCPU and 8 GB RAM is enough to begin with, and storage can be sized to your document volume.

A few features need more server capacity than the basic setup. Virus scanning adds roughly 1 to 2 GB of memory use and is best run on a server with 8 GB of RAM or more. Video streaming and Office document preview both put extra load on the CPU. We will confirm the final specification once we know which of these you want switched on. Document pages are rendered on the server, so watermarks and page-level analytics are applied there and not in the viewer's browser.

> **Note:** We recommend hosting the platform on Alibaba Cloud, using its Saudi (Riyadh) region. It is cost-effective, reliable, and keeps your data inside the Kingdom, which helps with PDPL requirements. We can help you choose the right plan and set up the account. The hosting subscription itself is paid directly by Allure Clinic.

## 3. Future add-ons

The platform is built so these can be added later. Each will be quoted separately when you are ready:

- **Built-in AI features:** automatic document summaries, answers to questions based on document contents, and auto-tagging of incoming uploads.
- **Digital signature:** patients, staff or vendors can sign documents online, and a full audit trail is kept for each signature.

## 4. What is not included

- Server, domain and hosting costs, which are paid directly by Allure Clinic.
- An Arabic (RTL) interface. We can quote this separately if needed.
- Custom integrations with other clinic systems, and any new features beyond what is listed in Section 1.
- Accounts and subscriptions with third-party services, such as an AI assistant provider or Slack.
- The add-ons in Section 3 (built-in AI features and digital signature). The AI support in Section 1 works through an external assistant.
- Bulk migration of existing document archives into the platform.

## 5. Timeline

Around 3 weeks from receipt of the advance payment, server access and your logo files. We will share a short go-live checklist once the order is confirmed.
